

ABSTRACT OF THE DISCLOSURE

Communication data is relayed to vehicle-mounted terminals in vehicles traveling in a particular area via vehicle-mounted terminals in vehicles. Each of the vehicle-mounted terminals functioning as intermediary terminals relays communication data to vehicle-mounted terminals in vehicles existing in a particular direction only until the communication data reaches the vehicle-mounted terminal in the vehicle closest to the target position, i.e., the center of the particular area. The communication data having reached the vehicle-mounted terminal in the vehicle closest to the target position is relayed to surrounding vehicle-mounted terminals through broadcasting.
